

AMATEUR DRS SYSTEM FOR CRICKET

CENTRAL THESIS

My goal is to accurately objectify the LBW decision with one or two cameras, for amateur cricketers, by using computer vision and AI to create a successful ball-path prediction (Hawkeye).

EXPERT VOICES

“DRS is a good thing. It is fair for both teams. It removes the human error factor completely.” - *Virat Kohli, one of the greatest of all time.*

“The system gives players a sense of security. You know a bad decision won't ruin months of hard work.” - *Kumar Sangakkara, former player*

“DRS has cleaned up the game. We see fewer arguments on the pitch because players trust the technology.” - *Nasser Hussain, former player*

OPPOSITION

Cricket in the US is not very popular and amateur games are left with substandard umpiring that can ruin matches with a few decisions.

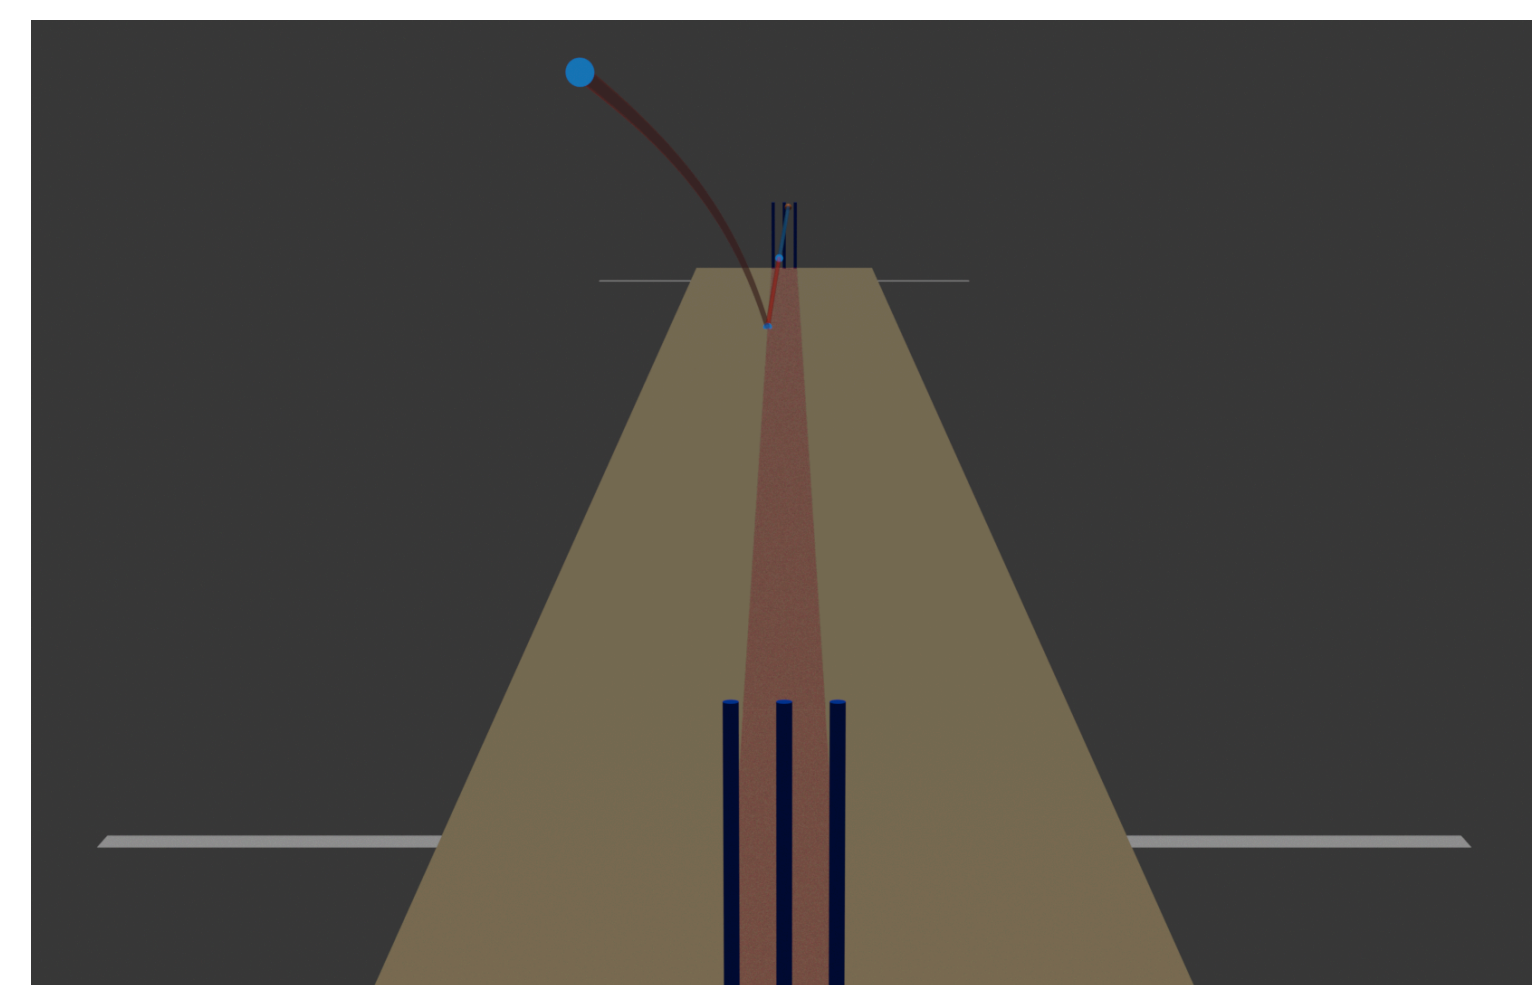

SOURCES

CALL TO ACTION

As a player myself, I know the pain of a bad decision and how costly they can be. With my knowledge of computer science and the rise of AI, this computer science project was a perfect integration of both hobbies.

The push of Cornerstone was perfect to think of a creative and helpful project like this one.
